

### 3. Problem Statement

1. Write a program in Java to show the use of super and this keyword with a constructor, methods, variables.
2. Create a class Student which has some private data like name, phone number, roll number, class, use getter and setters to access this private data.

## **Solution**

```
import java.util.Scanner;

class Employee
{
    String name;
    int age;
    //Constructor same name as of class
    Employee()
    {
        Scanner sc=new Scanner(System.in);
        System.out.println("Enter the name ");
        name=sc.next();
        System.out.println("Enter age ");
        age=sc.nextInt();
    }
    //function overloading
    void input(String name, int age)// now the names of the parameters and data member names are same
    {
        //using this keyword to show that which name belongs to where
        this.name=name;
```

```

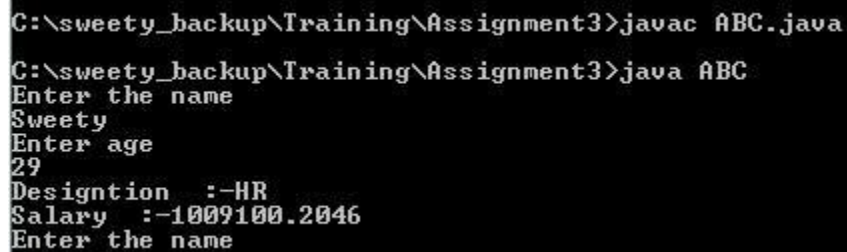

this.age=age;
}
void output()
{
System.out.println("Name :-" + name);
System.out.println("Age :-" + age);
}
}

```

```

//main class
class XYZ
{
public static void main(String a[])
{
//object reference for employee class
Employee e1=new Employee();
e1.output();
//passing parameter
e1.input("Seema",12);
e1.output();
}
}

```

```

C:\sweety_backup\Training\Assignment3>javac ABC.java
C:\sweety_backup\Training\Assignment3>java ABC
Enter the name
Sweety
Enter age
29
Designation :-HR
Salary :-1009100.2046
Enter the name

```

```

import java.util.Scanner;
//company extends all the properties of class employee
class Company extends Employee
{
    String designation;
    double salary;
    //constructor
    Company()
    {
        super();//this will call the constructor of parent class
        designation="HR";
        salary=1009100.2046;
    }
    void input()
    {
        Scanner sc=new Scanner(System.in);
        System.out.println("Enter the designation ");
        designation=sc.next();
        System.out.println("Enter Salary ");
        salary=sc.nextDouble();
    }
    void output()
    {
        System.out.println("Designation :-" + designation);
        System.out.println("Salary :-" + salary);
    }
}
//main class
class ABC
{

```

```

public static void main(String a[])
{
    Company f1=new Company();
    f1.output();
    Company Comp[]=new Company[5];
    for( int i=0;i<5;i++)
    {
        Comp[i]=new Company();
        Comp[i].input();
    }
    System.out.println("Information of ALL Companies");
    for( int i=0;i<5;i++)
    {
        Comp[i].output();
    }
}
}
}

```

Result

```

Enter the name
hima
Enter age
45
Enter the designation
Doc
Enter Salary
235990
Information of ALL Companies
Designation :-IT
Salary :-45600.0
Designation :-Sales
Salary :-345600.0
Designation :-Admin
Salary :-56909.0
Designation :-Regiteray
Salary :-5701.0
Designation :-Doc
Salary :-235990.0
C:\sweety_backup\Training\Assignment3>javac XYZ.java

```

2. Create a class Student which has some private data like name, phone number, roll number, class, use getter and setters to access this private data.

## **Solution**

```
import java.util.Scanner;

class Student
{
    //private datatype initializing
    private String name;
    private long phone;
    private int roll_no;
    private int class1;

    //Constructor
    Student()
    {
        Scanner st=new Scanner(System.in);
        System.out.println("Enter the name of student");
        name=st.next();
        System.out.println("Enter phone number of student ");
        phone=st.nextLong();
        System.out.println("Enter Roll number of student ");
        roll_no=st.nextInt();
        System.out.println("Enter Class of student ");
        class1=st.nextInt();
    }

    //functions-- setter
```

```
void input(String name, long phone, int roll_no, int class1)
```

```
{
```

```
    this.name = name;
```

```
    this.phone = phone;
```

```
    this.roll_no = roll_no;
```

```
    this.class1 = class1;
```

```
}
```

```
// Function--getter
```

```
void output()
```

```
{
```

```
    System.out.println("Name :-" + name);
```

```
    System.out.println("number :-" + phone);
```

```
    System.out.println("roll_no :-" + roll_no);
```

```
    System.out.println("class1 :-" + class1);
```

```
}
```

```
}
```

```
class MainStudent
```

```
{
```

```
    public static void main(String a[])
```

```
    {
```

```
        Student s1=new Student();
```

```
        s1.output();
```

```
    }
```

```
}
```

Screen Shot of the output

```
C:\sweety_backup\Training\Assignment3> java MainStudent
Enter the name of student
Sweety
Enter phone number of student
2345678000
Enter Roll number of student
56
Enter Class of student
8
Name      :-Sweety
number    :-2345678000
roll_no   :-56
class1    :-8
C:\sweety_backup\Training\Assignment3>
```
